Node.js

Modules

Purpose of modules

to package JavaScript code for reuse

Node.js has two module systems

1. CommonJS modules
2. ECMAScript modules

Enabling CommonJS modules

- package.json

```
{
  'type': 'commonjs',
  …
}
```

Enabling ECMAScript (ES) modules

- package.json

```
{
  'type': 'module',
  …
}
```

Modules are defined using a variety of import and export statements

Example of an ES module exports a function

```
// addTwo.mjs

function addTwo(num) {

  return num + 2;

}

export { addTwo };
```

```
// app.mjs

import { addTwo } from
'./addTwo.mjs';

// Prints: 6

console.log(addTwo(4));
```

You can export

- function
- var
- let
- const
- class

Loading non-JavaScript resources

```
import colors from "./colors.json" with { type: "json" };

import styles from "./styles.css" with { type: "css" };
```
